AI is a game changer in network security, enabling organizations to detect and respond to threats in real time. With Prisma SASE from Palo Alto Networks and AIOps from NTT DATA, networking and security functions converge within a unified cloud-native architecture to revolutionize network management and security.

**Benefits of SASE**

**Streamline administrative duties**
- AI reduces noise and enriches tickets.
- Operations teams can quickly troubleshoot the incidents.

**Mitigate risk and maintain network integrity**
- AI and Prisma SASE continuously monitor network traffic and behavior.
- Identifies patterns or activities that may indicate security threats or performance issues.

**Proactive issue detection and resolution**
- NTT DATA’s AIOps and Palo Alto Networks Prisma SASE analyze historical data to identify recurring patterns and underlying network problems and address them proactively.
- Minimizes disruptions, enhances network performance and improves the user experience.

**Scalability and adaptability**
- SASE is highly adaptable and scalable, accommodating changing business needs efficiently.
- Can easily scale with business growth, acquisitions or the addition of new locations.

**Enhanced network performance and reduced latency**
- AI optimizes network performance by dynamically routing traffic and identifying network issues in real time.
- Minimizes downtime and improves network availability.

Palo Alto Networks Prisma SASE and AIOps from NTT DATA bring the power of AIOps to the forefront of network management.

Organizations are increasingly relying on their networks but only 2 in 5 strongly agree their current network objectives are being met.

Security is essential:

- 95% of organizations are investing in their cybersecurity capabilities.
- 91% plan to move to identity-based security.
- 93% believe new threats will create increased security demands.
